NWP SAF 1D-Var Top-Level Design

This documentation was developed within the context of the EUMETSAT Satellite Application Facility on Numerical Weather Prediction (NWP SAF), under the Cooperation Agreement dated 7 December 2016, between EUMETSAT and the Met Office, UK, by one or more partners within the NWP SAF. The partners in the NWP SAF are the Met Office, ECMWF, DWD and Meteo France.

1. INTRODUCTION

The NWPSAF 1D-Var package is designed as a stand-alone retrieval scheme for use with many nadir-viewing passive sounders. It is designed to be flexible in so far as the instrument definition, observations, error covariances, background profiles, channel selection and retrieval parameters are specified in input files. The user may choose which radiative transfer model to use from those supported (RTTOV 11.3, RTTOV 12). If an alternative forward model is required, the user will need to provide their own interface module. The retrieved atmospheric profiles and brightness temperatures are output to an ASCII file.

The overall design of the package is summarised in the following flowcharts.

2. OVERVIEW

3. INITIALISATION

- Read in control data
- Initialise reading in of observations
 - Observations are read in one at a time in the processing stage
- Read in background
- Read in parameters to be retrieved
- Read in channel selection information
- Initialise RT model and read in RT model coefficients
- Read in background error covariance matrix
 - Includes possible matrix inversion
- Read in observation + forward model error

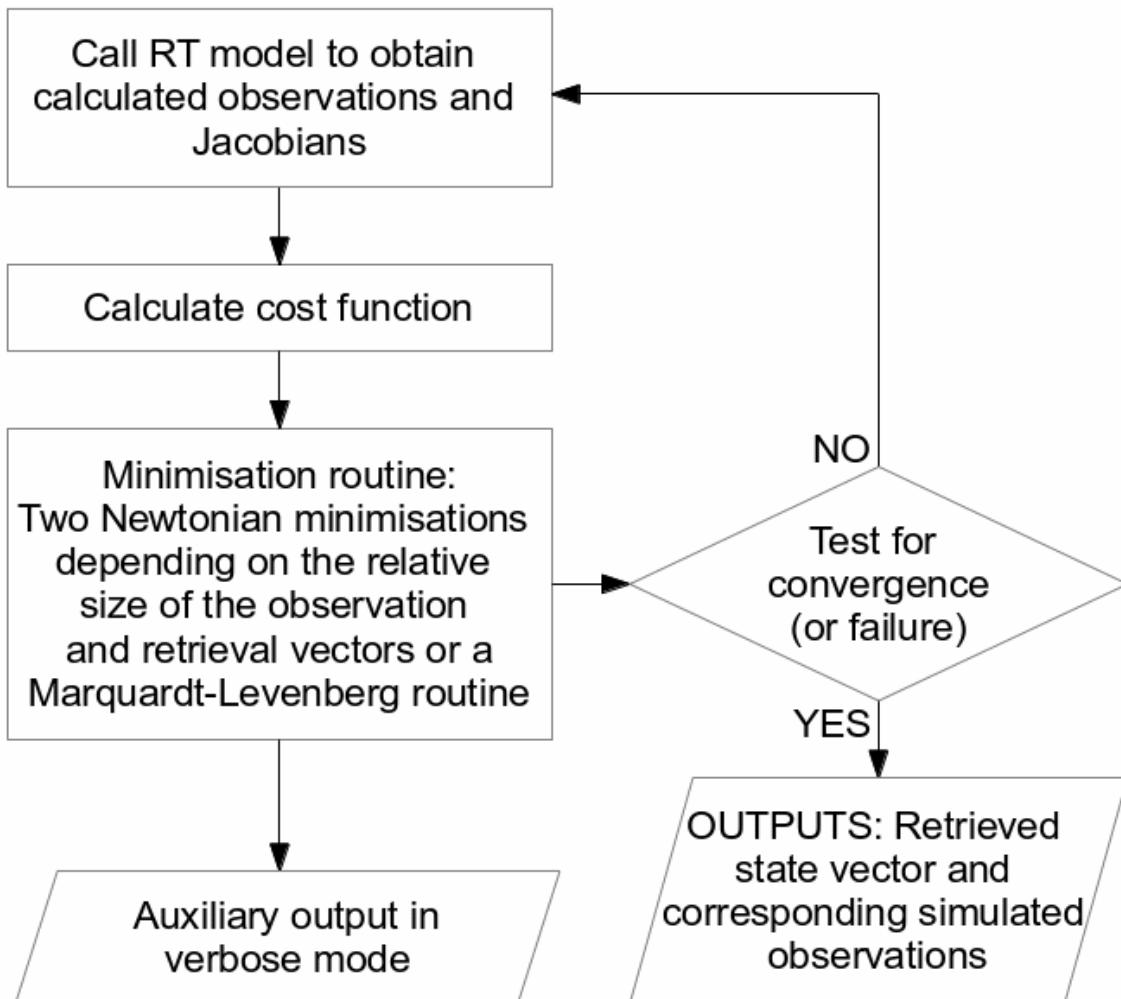

4. PROCESSING INPUT

For each observation:

- Read in observation
- Space for user supplied bias correction to be added
- Convert background profile to correct units
- Produce simulated radiances from background profile
 - Extrapolate temperature profile at top of atmosphere (optional)
- Do cloud detection (optional)
- Do CO₂ slicing for first guess cloud properties (cloudy retrievals only)
- Obtain emissivity from atlas (optional)
- Do emissivity retrieval (optional)

5. MINIMISATION AND OUTPUT

The EUMETSAT Network of Satellite Application Facilities	 NWP SAF Numerical Weather Prediction	NWPSAF 1D-Var Top-Level Design	Doc ID : NWPSAF-MO-DS-026 Version : 1.2 Date : 24/02/2020

6. SUBROUTINE CALLING TREE

6.1 GENERAL NOTES FOR INTERPRETING CALLING TREES

* Indicates multiple references in calling routine

† indicates that **NWPSAF_OpenFile.f90** and/or **NWPSAF_FreeLUN.f90** are called.

NWPSAF_OpenFile.f90 calls **NWPSAF_GetUnit.f90**

NWPSAF_Report.f90 is called by many routines to generate error or information messages

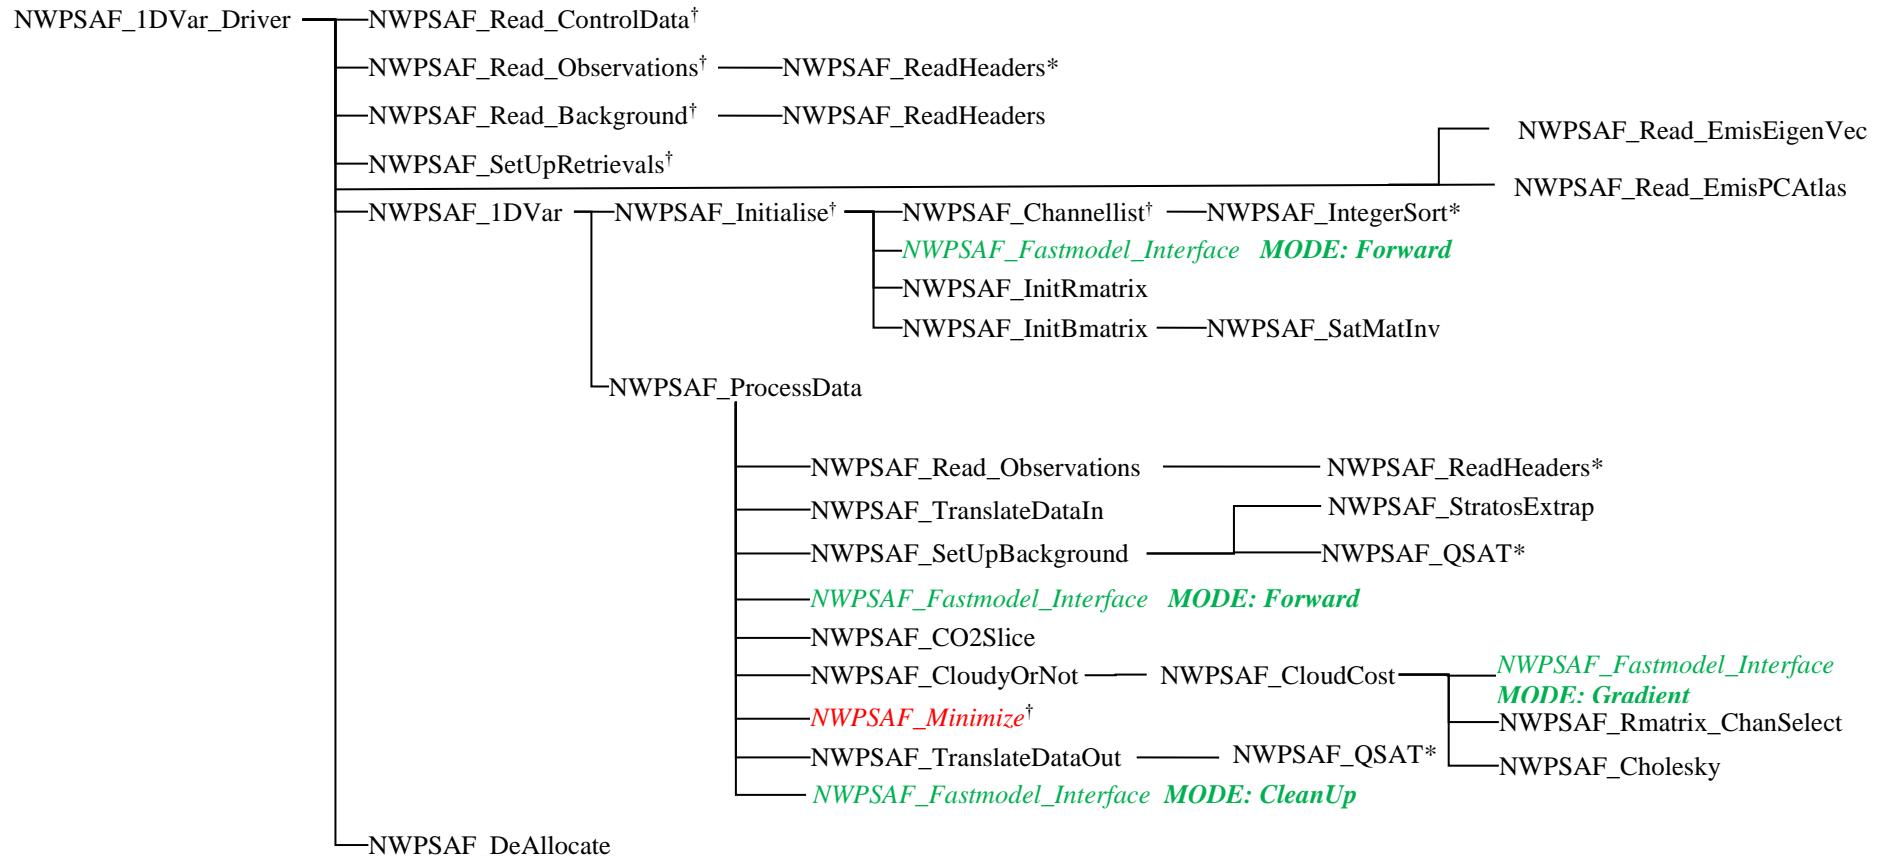

In the following calling trees, please follow on to the sub-tree on the next pages when you see a coloured routine, namely:

- **NWPSAF_Minimize**
- **NWPSAF_Fastmodel_Interface**

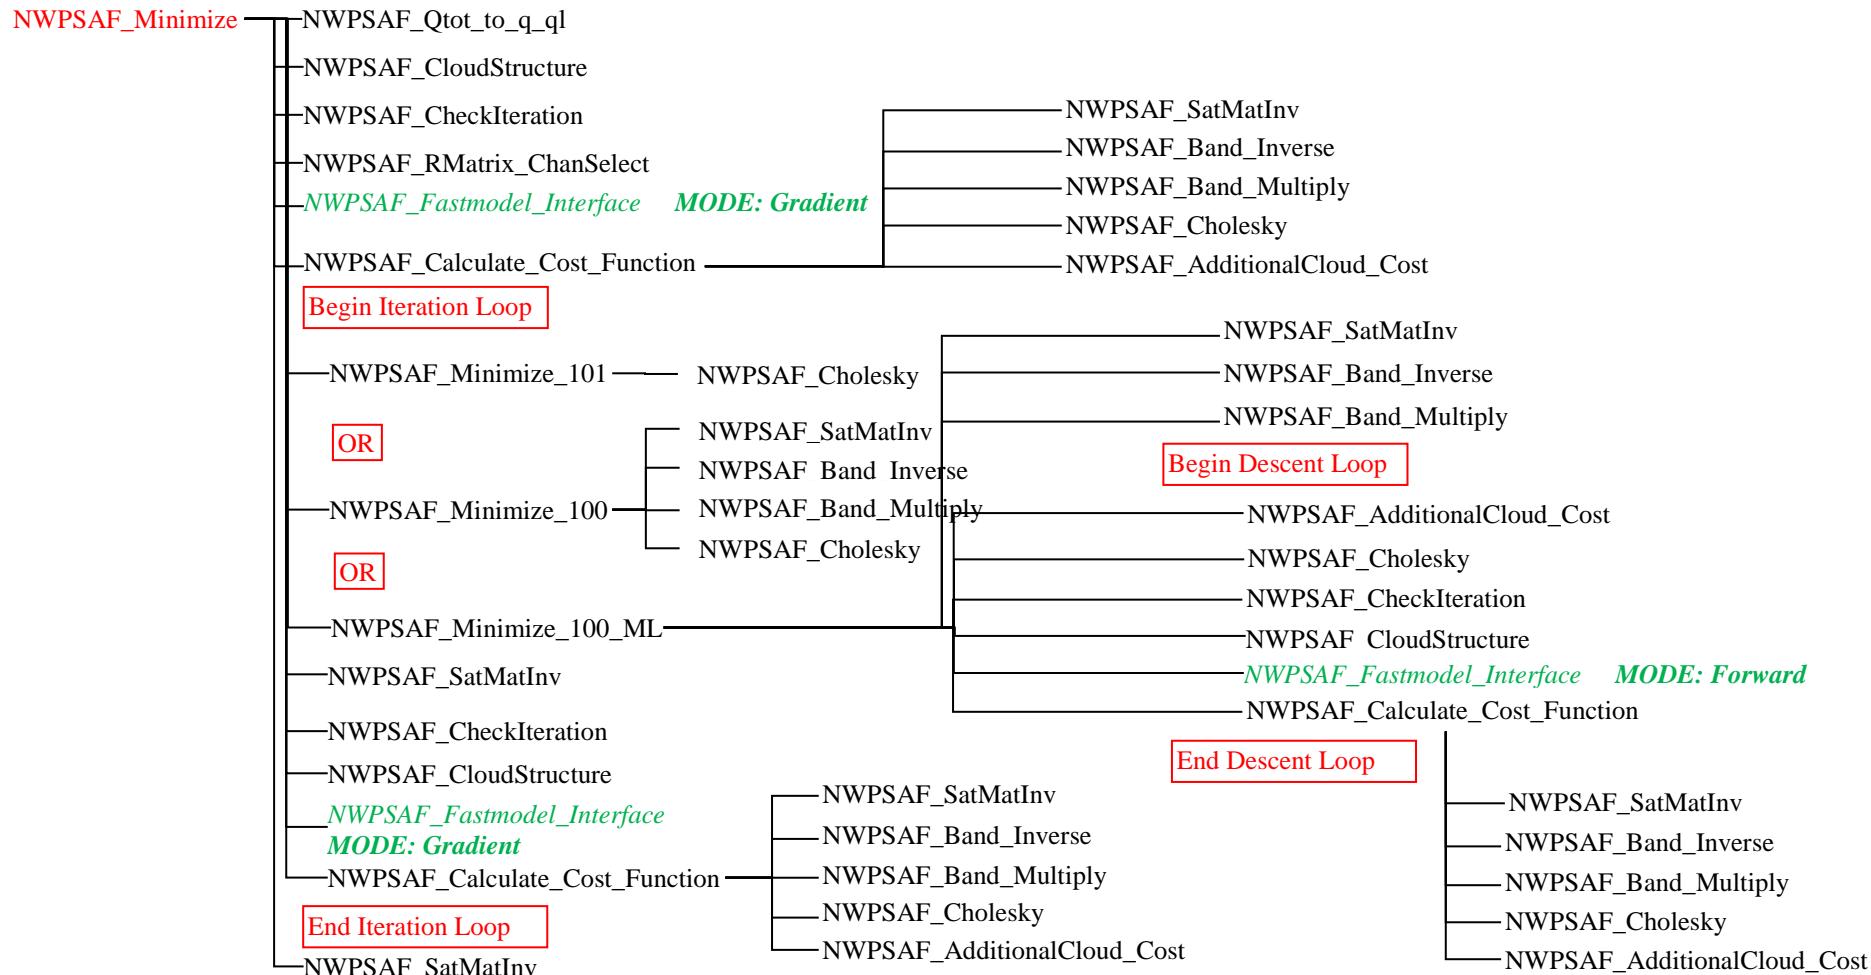

In addition to the subroutines listed below, the following modules are used in the code:

- **NWPSAFMod_Constants.f90** (contains various constants used in the code)
- **NWPSAFMod_Params.f90** (contains all of the set up options and the Control namelist)
- **NWPSAFMod_RTModel.f90** (contains the RTTOV coefficients, options and chanprof structures, and the emissivity atlas if required)
- **NWPSAFMod_Channellist.f90** (contains the channel selection type structure)
- **NWPSAFMod_CovarianceMatrices.f90** (contains all of the covariance matrices used in the code)
- **NWPSAFMod_ObsInfo.f90** (contains the profile and observation type structures)
- **NWPSAFMod_LiquidWater.f90** (contains various functions related to retrieval of liquid water)

6.2 MAIN CALLING TREE

6.3 NWPSAF_MINIMIZE CALLING TREE

6.4 NWPSAF_FASTMODEL_INTERFACE CALLING TREE
