NWP SAF	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
---------	--	---

# 1 Introduction

This document is the test plan and test report for the Pencil beam Wind Processor (PenWP) software package. It is set up according to the guidelines of the NWP SAF; see the NWP SAF Development Procedures for Software Deliverables. Parts of the PenWP developments are in fact genscat developments. The tests for genscat modules are also included in this document. Part of the test plan is a traceability matrix to show how requirements as described in the Product Specification [2] are related to the tests in this document.

Most of the module tests described in this document have been developed and performed for OWDP (the OSCAT Wind Data Processor), AWDP (the ASCAT Wind Data Processor) and SDP (the SeaWinds Data Processor) a large part of the code in genscat is shared between PenWP and other NWP SAF wind processors. For this new PenWP version, all module tests have been repeated.

## 1.1 Aims and scope

The Pencil Beam Wind Processor (PenWP) is a software package written mainly in Fortran 90 with some parts in C for handling data from the SeaWinds (on QuikSCAT or ADEOS-II), OSCAT (on Oceansat-2 or ScatSat-1), HSCAT (on HY-2A) and RapidScat (on the International Space Station) scatterometer instruments. Details of these instruments can be found in [4] and [5], respectively, and on several web sites, see e.g. information on the NASA and ISRO web sites. PenWP is intended to be a generic wind processor for Ku band pencil beam scatterometer data. It will be adapted to handle data from future instruments like the OSCAT successor ScatSAT (from ISRO) once they become available.

PenWP generates surface winds based on pencil beam radar backscatter data. It allows performing the ambiguity removal with the Two-dimensional Variational Ambiguity Removal (2DVAR) method and it supports the Multiple Solution Scheme (MSS). The output of PenWP consists of wind vectors which represent surface winds within the ground swath of the scatterometer. Input of PenWP is Normalized Radar Cross Section (NRCS,  $\sigma^0$ ) data. These data may be near real-time. The input files of PenWP are in BUFR. Conversion programs are included in the package to convert Hierarchical Data Format (HDF5) data from various instruments to BUFR. Output is written using the SeaWinds BUFR template or the KNMI BUFR template with generic wind section.

Depending on the grid spacing of the BUFR product, PenWP will process the data on 25 km, 50 km or 100 km grid spacing. The SeaWinds/RapidScat HDF5 to BUFR converter can create BUFR data on 25, 50 or 100 km grid spacing by averaging the backscatter data in the level 2a input file to the requested gridding. The OSCAT HDF5 to BUFR converter will create BUFR data with the same grid spacing as the level 2a input file. This can be 50 km when using the level 2a input data from the Indian Space Research Organisation (ISRO), or 25 km when using level 1b

NWP SAF	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
---------	--	---

input data from ISRO in combination with a separate OSCAT level 1b to level 2a converter which is also included in the software package and which is based on software provided by NOAA. HY-2A input data are currently available on 25 km grid spacing but can also be averaged to a 50 km product.

Apart from the scatterometer input data, PenWP needs Numerical Weather Prediction (NWP) model winds as a first guess for the Ambiguity Removal step. These data need to be provided in GRIB edition 1 or 2.

## 1.2 Development of PenWP

PenWP is developed within the Numerical Weather Prediction Satellite Application Facility (NWP SAF) and Ocean and Sea Ice Satellite Application Facility (OSI SAF) projects as code which can be run in an operational setting. The coding is mainly in Fortran 90 with some parts in C and has followed the procedures specified for the NWP SAF. Special attention has been paid on robustness and readability. PenWP may be run on every modern Unix or Linux machine. In principle, PenWP can also be run on a Windows machine if a Linux environment like the Windows Installer for Ubuntu (Wubi) is installed. Details on the PenWP package can be found in [1], [2] and [3].

## 1.3 Testing PenWP, traceability matrix

This section describes the Test Plan of the PenWP deliverable. Tests have been carried out in all stages of the development of PenWP. The inversion module is not tested for the PenWP package, because such a test has already been made for the QuikSCAT Data Processor (QDP) development. PenWP contains several methods for Ambiguity Removal within module *ambrem* and its sub modules. Only modules needed for the KNMI 2DVAR scheme for Ambiguity Removal are tested within this project.

Compilation is done on several platforms (operating systems) and with different Fortran 90 compilers. The integration and validation tests were done on both a Linux work station and a Linux server environment.

Section 2 contains the tests for a number of individual modules. In general, modules are tested with the associated test programs. The test programs are located in the folder containing the module under consideration. The output of the test programs is always the standard output (screen) which may be redirected to any test log file or to some output files which are stored in the associated folders. Section 3 describes the PenWP integration test. A test folder containing some sample data is provided with PenWP and some of the resulting wind fields from these data are shown. Section 4 discusses the validation tests. PenWP has been compared with ECMWF model winds in the scope of this report, buoy validations are or will be performed in the scope of the OSI SAF. Section 4 also contains a technical check of the ice screening algorithm. Section 5 describes the portability tests. It contains an overview of platform/operating systems and Fortran and C compilers for which PenWP is supported. Finally, section 6 is devoted to testing the user documentation.

The table below is the traceability matrix. It shows the requirements in the Product Specification [2], how they are tested and where in this report these tests are described.

<b>NWP SAF</b>	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
----------------	--	---

<b>Requirement</b>	<b>Section of PS</b>	<b>Testing method</b>	<b>Test plan reference (section)</b>	<b>Comment</b>
PenWP generates surface winds	2.1, 3.5, 3.7	Process L2A file in penwp/test folder and inspect output	3.1	
PenWP generates BUFR output in NOAA format and in KNMI format	2.1, 3.1	Process L2A file in penwp/test folder and inspect output	3.1	
PenWP generates output in the same WVC spacing as the input data	2.2, 3.2	Process L2A file in penwp/test folder and inspect output	3.1	
PenWP output contains latitude, longitude and other parameters	2.2	Process L2A file in penwp/test folder and inspect output	3.1	
PenWP can use either L2A HDF5 data or BUFR data as input (HDF5 after conversion to BUFR)	2.3	Process L2A HDF5 data in penwp/test folder and subsequently reprocess BUFR output	3.1	
PenWP reads GRIB data containing LSM, SST and forecast winds	2.3	Process L2A file in penwp/test folder and check that a consistent wind field is obtained	3.1	
PenWP will compile and run on different Linux and Unix platforms	2.4	Compile and run PenWP on different platforms	5	
L2A backscatter slices are averaged correctly, unusable backscatter data are rejected.	3.2	Process a few orbits of L2A data and compare output winds to ECMWF background.	4.1	When averaging is not done well, a noisy or inconsistent wind field is obtained. This is reflected in the statistics of scatterometer winds vs. ECMWF.
Atmospheric attenuations are computed and stored in output	3.3	Process L2A file in penwp/test folder and inspect output	3.1	Atmospheric attenuations should be in the order of 0.2 to 0.3 dB
WVCs with high MLEs must be rejected by Quality Control	3.4	Process L2A file in penwp/test folder and check if QC flag is set for high MLE values	3.1	
Bayesian ice screening is implemented	3.6	Process a few orbits of L2A data and inspect ice maps	4.2	
A product monitoring flag is implemented	3.8	Not tested since there are no data with anomalous instrument performance available	-	
PenWP can process data within reasonable CPU time.	3.9	Process L2A file in penwp/test folder and check processing time.	3.1	

**Table 1.1** Traceability matrix.

## 1.4 Test folders

The Test folder of the PenWP software package is located in subdirectory `penwp/test.s`. This

<p><b>NWP SAF</b></p>	<p><b>PenWP Test Plan and Test Report</b></p>	<p>Doc ID : NWPSAF-KN-TV-008  Version : 2.2  Date : May 2018</p>
-----------------------	---	--

subdirectory contains several input files for PenWP that are discussed in more detail in section 3. The scripts for executing these tests are located in directory `penwp/execs`. It is recommended to use these scripts (or a modified version) also for normal PenWP operation, as the environment variables needed by PenWP are set in these scripts.

As stated before, most test programs are located in the same directory as the module to be tested. See section 2 for detailed information.

## 1.5 Conventions

Names of physical quantities (e.g., wind speed components  $u$  and  $v$ ), modules (e.g. *BufMod*), subroutines and identifiers are printed italic.

Names of directories and subdirectories (e.g. `penwp/src`), files (e.g. `penwp.F90`), and commands (e.g. `penwp -f input`) are printed in Courier. Software systems in general are addressed using the normal font (e.g. PenWP, genscat).

Hyperlinks are printed in blue and underlined (e.g. <http://www.knmi.nl/scatterometer/>).

<b>NWP SAF</b>	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
----------------	--	---

## 2 Module tests

In this section the various tests to individual modules within PenWP are presented. The tests are listed alphabetically in the module name. Table 2.1 gives an overview of the modules tested, their location and the name of the associated test programs.

Module tests have been included in PenWP if the following conditions were satisfied:

1. The test does not require additional software.
2. The output of the test program is self-explanatory enough to judge the outcome of the test.

<b>Module name</b>	<b>Location</b>	<b>Test program</b>
<i>BFGSMod</i>	genscat/support/BFGS	<i>Test_BFGS</i>
<i>BufrMod</i>	genscat/support/bufr	<i>test_modules</i>
<i>convert</i>	genscat/support/convert	<i>test_convert</i>

<i>SortMod</i>	genscat/support/sort	<i>SortModTest</i>

**Table 2.1** Overview of module tests.

### 2.1 Module *BFGSMod*

Directory genscat/support/BFGS contains program Test\_BFGS. This program tests the minimization routine LBFGS and its associated routines in module *BFGSMod*. The routines in *BFGSMod* are slightly modified versions of the freeware routine LBFGS and its subroutines. LBFGS was written by J. Nocedal, see [6].

Program Test\_BFGS finds the minimum of the function

$$f(x) = \sum_{i=1}^{100000} (x-i)^4$$

The minimum is the point (1, 2, ..., 100000). The search starts at the origin. The typical output is shown in table 2.2.

<b>NWP SAF</b>	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
----------------	--	---

   0  0.20001E+25
   1  0.19527E+25
   2  0.17724E+25
...
  84  0.29492E-15
  85  0.95608E-16
  86  0.30995E-16

Routine LBFGS completed succesfully
Number of iterations      :      87
Dimension of problem      :    100000
Number of corrections in BFGS update :      5
Cost function at start    :    0.20001D+25
Cost function at end      :    0.30995D-16
Precision required        :    0.10D-19
Norm of final X           :    0.18258D+08
Norm of final G           :    0.97625D-13
Minimum and Maximum error in solution : 0.000003 0.000005
Time needed               :    0.460 seconds

Program Test_BFGS completed succesfully.

```

---

**Table 2.2** Output of program Test\_BFGS.

## 2.2 Module *BufrMod*

Directory `genscat/support/bufr` contains program `test_modules`. This program is compiled and called automatically by the `genscat` make system, since it is needed to translate the ASCII BUFR tables to binary form. It will also read in a small BUFR test file, decode it, encode the data again and write them to an output BUFR file. Hence, the program can be used to check the BUFR library. Table 2.3 shows the output generated by `test_modules`. The program can be invoked by calling the shell script `run_test_modules`, which sets the environment variable `$BUFR_TABLES` and calls `test_modules`.

**Table 2.3** Output of program `test_modules`.

### 2.3 Module *convert*

Directory `genscat/support/convert` contains module *convert.F90*, a number of routines for the conversion of meteorological and geographical quantities. Its associated test program is *test\_convert*, and part of its output is listed in table 2.4. Program *test\_convert* produces quite a lot of output.

It starts with checking some conversions between different wind vector representations and transformations between different geographical coordinate systems, followed by a check of the transformation from orbit angles ( $p, a, \text{rot}(z)$ ) to three-dimensional position ( $x, y, z$ ).

Only the results for  $p = 0^\circ$  and  $90^\circ$  are (partly) shown in table 2.4; those for  $p = 10^\circ, 45^\circ$ , and  $70^\circ$  are omitted. Program *test\_convert* ends with some trigonometric calculations on a sphere.

**Table 2.4** Output of program *test\_convert*

## 2.4 Modules *CostFunction* and *StrucFunc*

Module *CostFunc.F90* in directory *genscat/ambrem/twodvar* contains the cost function definition of the 2DVAR method. Module *StrucFunc* in the same directory contains the error covariance model of the background field. Large parts of these modules are tested in the single observation solution test implemented in program *Test\_SOS*. Table 2.5 lists its output.

The main idea behind this test is that the 2DVAR analysis increment can be calculated analytically in case of one single observation with unit probability. Starting with zero background increment and an observation increment  $(t_o, l_o)$  on the 2DVAR grid at the position with indices (1,1), the initial total cost function equals

$$J_t^{init} = \frac{t_o^2 + l_o^2}{\varepsilon^2}$$

where  $\varepsilon$  stands for the standard deviation of the observation error, which is set to 1.8 in *Test\_SOS*. The 2DVAR problem now reduces to a simple optimal interpolation problem. If the standard deviation of the background error is set to the same value as that of the observation error, the final solution has  $J_t^{fin} = J_o^{fin} + J_b^{fin} = 1/2 J_t^{init}$  with  $J_b^{fin} = J_o^{fin}$ . This allows construction of the final solution and its gradient, see [7] for more detailed information and a complete description of the 2DVAR method.

Program *Test\_SOS* reads the observation increment and the structure function parameters from an input file with default name *Test\_SOS.inp*, see below. There are two modes for calculating the Helmholtz transformation coefficients, controlled by the variable *Mode* in routine *Set\_HelmholzCoefficients* in module *CostFunc.F90*. *Mode* is a character variable of length 2. Its default value is 'JV' which stands for sampled continuum (the other value is 'HB' which stands for periodic boundary conditions but these do not reproduce the correct scaling, see [7] for more details). The program copies the structure function parameters into the *SF*-struct, and the observation increments in the *TwoDvarObs*-struct. The structure function parameters are printed by routine *PrnStrucFuncPars*.

The error covariances are calculated numerically in module *StrucFunc*. For Gaussian structure functions, they can also be calculated analytically. The two methods are compared and the relative precision is printed. In table 2.5 it is 0.00345 for the stream function  $\psi$  and 0.0 for the velocity

<b>NWP SAF</b>	<b>PenWP Test Plan and Test Report</b>	Doc ID : NWPSAF-KN-TV-008 Version : 2.2 Date : May 2018
----------------	--	---

potential  $\chi$ , since the latter quantity is identically zero in this example. The precision of the covariances depends on the correlation lengths  $R_\psi$  and  $R_\chi$ .

The total cost function and its gradient is evaluated by routine *JoScat* in module *CostFunction*. From this the cost function components and gradients at the final solution are calculated and checked against their analytical value. The (absolute) precision is printed. Finally, *Test\_SOS* checks the packing and unpacking routines of the control vector in both directions.

As stated before, program *Test\_SOS* reads its input from an input file. The name (and path) of that file must be given as command line argument of *Test\_SOS*. When omitted, the program assumes *Test\_SOS.inp* as input file. Table 2.6 gives the structure and contents of the input file, which is in free format. The last decimals of the output values may depend on machine precision.

```

```

---

**Table 2.8** Output of program *TestErrorHandler*.

## 2.7 Module *gribio\_module*

Module *gribio\_module.F90* in directory `genscat/support/grib` contains routines for reading and decoding GRIB files. The module is tested by programs *test\_read\_GRIB1*, *test\_read\_GRIB2* and *test\_read\_GRIB3*, the output of which is listed in tables 2.9 to 2.11. The test programs read in two small GRIB files (`testfile.grib` in GRIB edition 1 format and `testfile.grib2` in GRIB edition 2 format) present in this directory and print some of their contents to the standard output. The environment variable `$GRIB_DEFINITION_PATH` needs to be set and has to point to the directory containing GRIB definition tables. These are available in `(...)/genscat/support/grib/definitions`.

----------------	--	---

### 3 PenWP integration test

Directory `penwp/tests` contains one HDF5 file for testing the PenWP executable. File `S1L2A2012006_12113_12114_2.h5.gz` contains (gzipped) OSCAT level 2a data from 6 January 2012, 13:51 to 14:03 UTC with 50 km cell spacing, as obtained from ISRO. The files `ECMWF*.grib` contain the necessary NWP data (SST, land-sea mask and wind forecasts) to perform the NWP collocation step.

The user can test the proper functioning of PenWP using the files in the `penwp/tests` directory. To do this, first create a small file containing a list of NWP files:

```
ls -l ECMWF_* > nwpflist
```

Note that the '-l' contains the number '1' and not the character 'l'. Then, gunzip the HDF5 file:

```
gunzip -c S1L2A2012006_12113_12114_2.h5.gz >
S1L2A2012006_12113_12114_2.h5
```

Set the `$BUFR_TABLES` environment variable:

```
export BUFR_TABLES=../../genscat/support/bufr/bufr_tables/
```

for Korn shell or Bourne shell or

```
setenv BUFR_TABLES ../../genscat/support/bufr/bufr_tables/
```

for C shell. Convert the level 2a input file to BUFR:

```
../execs/oscat_hdf2bufr -allswath -f S1L2A2012006_12113_12114_2.h5
-o oscat.bufr
```

Then run PenWP:

```
../execs/penwp_run -f oscat.bufr -nwpfl nwpflist -mss -mon -noc
-genericws 4
```

The result should be two OSCAT level 2 files in BUFR format, called

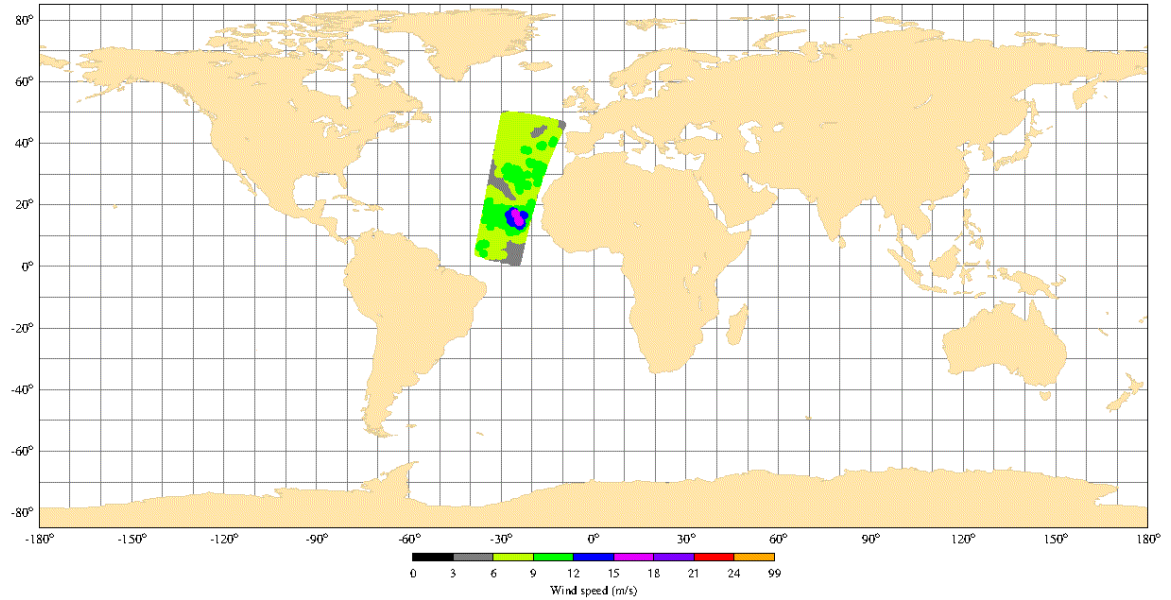

```
oscat_20120106_135109_ocsat2_12113_o_500_ovw_12.bufr and
oscat_20120106_135109_ocsat2_12113_o_500_ovw_12.bufr.genws.
```

The first file is in NOAA BUFR format and the second file is in KNMI format with generic wind section.

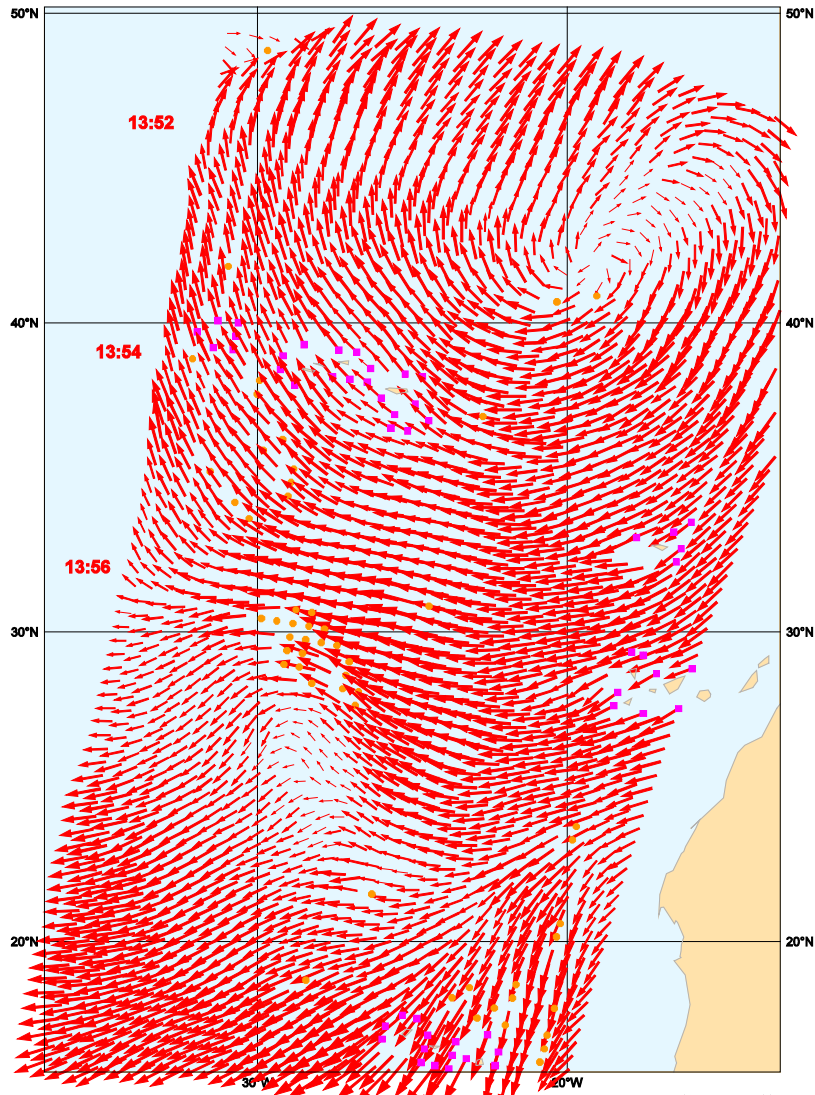

#### 3.1 OSCAT test data

Figure 3.1 shows the global coverage of the OSCAT test run on 50 km. The colours show the magnitude of the wind speed as indicated by the legend. Figure 3.2 shows detailed wind vector plots over the Atlantic west of Africa, with 50 km cell spacing. In the detail plot, a magenta marker on top of the wind arrow denotes land presence. Orange wind arrows indicate that the Variational

Quality Control flag is set, i.e. the Wind Vector Cell is spatially inconsistent. An orange dot means that the KNMI Quality Control Flag is set.

**Figure 3.1** Global coverage of the OSCAT test run. Wind speed results for the 50 km product are shown.

**Figure 3.2** Detail plot of the OSCAT test run. Wind vectors for the 50 km product are shown.

Table 3.1 shows one decoded Wind Vector Cell of the resulting output file in NOAA BUFR format and table 3.2 the same WVC in KNMI BUFR format with generic wind section.

**Table 3.2** Wind Vector Cell in KNMI BUFR format with generic wind section

From the plots and tables in this section it is clear that:

- Output can be provided in two BUFR formats.
- The Wind Vector Cell spacing is 50 km, see fields 6 and 7 in the BUFR outputs and figure 3.2.
- The output contains latitude, longitude, time, orbit and node numbers, NWP background wind vector, WVC quality flag, and information on the radar backscatter including  $\sigma^0$  and  $K_p$  data.
- A consistent wind field is obtained which proves that both HDF5 and GRIB data are read successfully.
- The atmospheric attenuations are present in the BUFR output (fields 62, 77, 92 and 107 in the NOAA BUFR format).

The test was re-run with the BUFR output file as input and this results in a new output file with the same wind information. Hence, it is clear that PenWP accepts BUFR data as input as well as HDF5.

Table 3.3 shows what happens when the MLE value exceeds the threshold for Quality Control. The MLE of the fourth wind solution (the selected one by ambiguity removal) is contained in field 49 and has a value of 94.38. This is above the threshold value of 14.4 corresponding to wind speeds close to 9 m/s. The Wind Vector Cell Quality (field 21) has an integer value of 1028, i.e., Fortran bits 10 and 2 are set, corresponding to the flags for KNMI Quality Control and Rain.

----------------	--	---

The processing of the test file (1/8<sup>th</sup> of a full orbit) takes ~3 seconds on a Linux workstation with an Intel Xeon quad core CPU at 3.20GHz and 8 GB of memory. Hence the OSCAT wind processing can be done easily in near-real time on an affordable computer system.

## 4 Validation tests

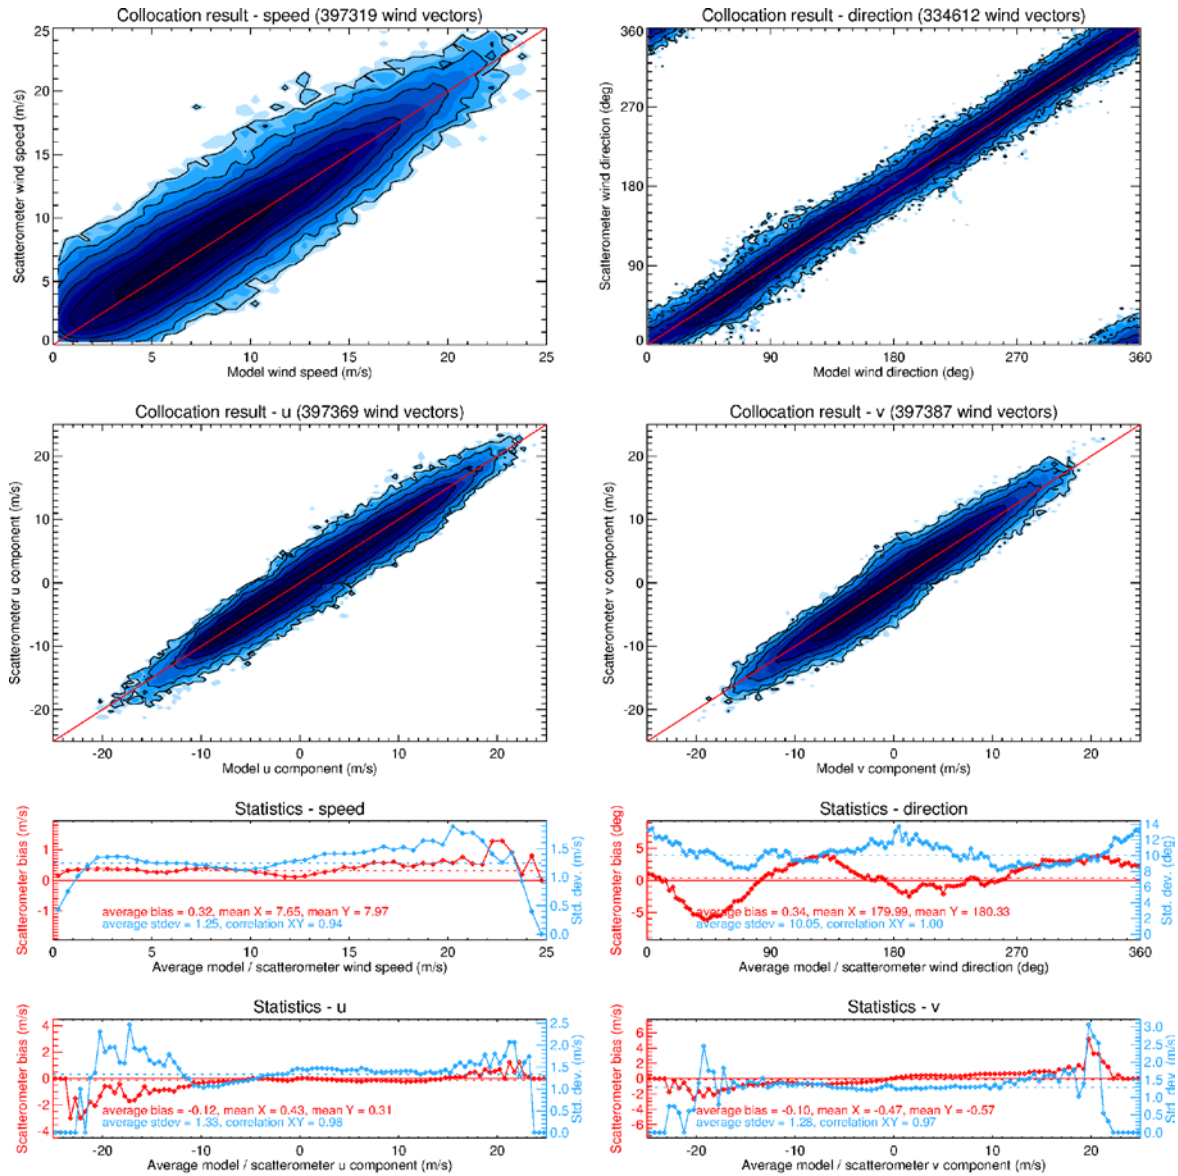

There are several methods to validate scatterometer winds. Scatterometer winds are routinely compared with NWP data and in situ buoy winds in the OSI SAF project. See <http://www.knmi.nl/scatterometer/osisaf/> for more information. In the scope of this Test Report, we show the results of a validation study of PenWP winds versus model wind forecasts from the ECMWF model. The correct implementation of the ice screening algorithm is demonstrated in section 4.2.

### 4.1 PenWP winds versus ECMWF winds

We compared the OSCAT winds from PenWP with ECMWF forecast winds from the operational model (+3 to +21 hours forecasts from the 00 UTC and 12 UTC runs). The OSCAT data are level 2a data version 1.3 from ISRO from 9 and 10 February 2012 (28 orbits), reprocessed with PenWP.

Figure 4.1 shows the collocations of the OSCAT and ECMWF winds. Contoured histograms are shown for wind speed, wind direction and  $u$  and  $v$  wind components and after rejection of Quality Controlled (KNMI QC flagged) wind vectors. Note that the ECMWF winds are real 10m winds, whereas the scatterometer winds are equivalent neutral 10m winds, which are on average 0.2 m/s higher. In the wind direction plots, only those wind vectors where the model wind speed is at least 4 m/s are taken into account. The bin sizes for the histograms are 0.5 m/s for wind speed,  $u$  and  $v$ , and 2.5° for wind direction.

From the contour plots it is clear that biases are generally low. We obtain wind component standard deviations of 1.33 in  $u$  and 1.28 in  $v$  directions. This is comparable to the values we found for SeaWinds in the past: approximately 1.33 for  $u$  and  $v$  for the 25-km product and approximately 1.5 for both components for the 100-km product in the same period of the year. We expect that the OSCAT results can be improved by applying better calibration on the backscatter data. This is subject to further study in the NWP SAF and OSI SAF projects.

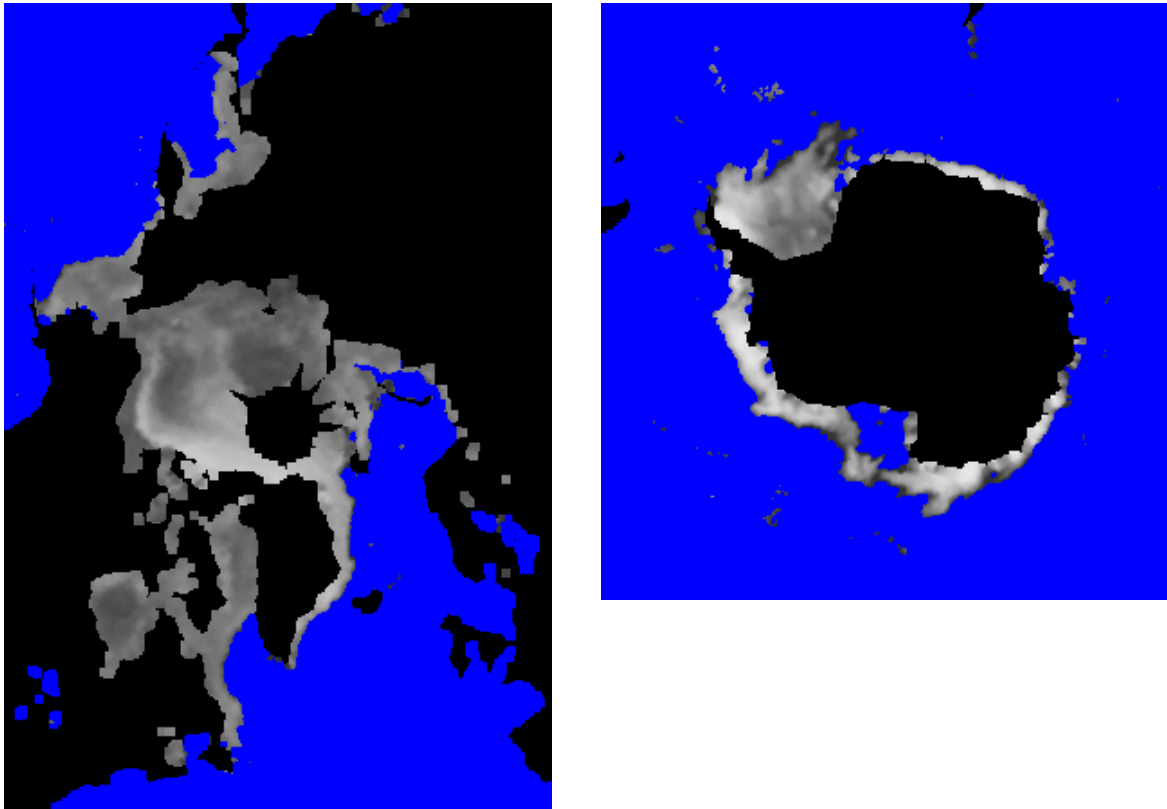

**Figure 4.1** Collocation results of Oceansat-2 winds from PenWP and ECMWF forecast winds. Biases and standard deviations in bottom plots are in m/s for wind speed and components, in degrees for wind direction.

## 4.2 Ice screening test

Figure 4.2 shows the ice maps for North and South poles after processing two days of data. The test data are the same as in the previous section, i.e., 9 and 10 February 2012. Ice maps of the North Pole and South Pole are provided. The blue parts in the maps indicate open water; the black parts correspond to land areas or areas not visited within these two days. The gray scale is a measure of the ice A-parameter (albedo). Multi year ice has in general a higher albedo than first year ice, so lighter areas correspond to older ice. In the scope of this report we did not verify the ice extent in detail with other measurements. More information about the ice screening algorithm can be found in [8].

---------	--	---

**Figure 4.3** PenWP ice maps for North Pole (left) and South Pole (right).

### 4.3 NBEC test

From version 2.1 onwards PenWP offers the possibility to use Numerical Background Error Correlations (NBECs) in 2DVAR. These lead to a better analysis and hence better agreement with buoy winds and lower setting frequencies of the KNMI QC and VarQC flags, but at the cost of increased processing time. A detailed account is given in [9].

----------------	--	---

## 5 Portability tests

The PenWP software package inherits its portability by using strict Fortran 90 code (with a few low level routines for reading and writing binary in C). PenWP is delivered with a complete make system. The Makeoptions include file of genscat takes care of the different settings needed under various platforms. This Makeoptions file is also used for the SeaWinds scatterometer wind processor SDP, The ASCAT wind processor AWDP and the OSCAT scatterometer wind processor OWDP.

The default platform for development is a Linux work station. Different Fortran 90 compilers were used to compile both genscat and PenWP. Table 5.1 provides an overview of the platforms and compilers on which PenWP was tested successfully.

<b>Platform</b>	<b>Operating system</b>	<b>Fortran compiler</b>
Intel-based workstation	Fedora Linux v.19 3.14.27-100.fc19.x86_64	GNU g95 v0.94 Portland f90 v11.10-0 gfortran v4.8.3-7 Intel Fortran v12.1.4
Linux cluster	Redhat Linux v5.11 2.6.18-404.el5	Portland f90 v11.8-0
Apple MacBook	MacOS X Darwin	GNU gfortran

**Table 5.1** Supported platforms and compilers for PenWP.

----------------	--	---

## 6 User documentation tests

The user documentation (readme files within the software package and the PenWP user documents, [1], [2], [3]) have been provided to beta testers for review. The beta tester's comments have been implemented in the user documentation. User feedback on the documentation will also be implemented in future versions of the documentation.

## Appendix A: Acronyms

Name	Description
ASCAT	Advanced SCATterometer on Metop
AWDP	ASCAT Wind Data Processor
BUFR	Binary Universal Form for the Representation of data
C-band	Radar wavelength at about 5 cm
ECMWF	European Centre for Medium-range Weather Forecasts
EUMETSAT	European Organization for the Exploitation of Meteorological Satellites
genscat	generic scatterometer software routines
KNMI	Koninklijk Nederlands Meteorologisch Instituut (Royal Netherlands Meteorological Institute)
Ku-band	Radar wavelength at about 2 cm
L1b	Level 1b product
LSM	Land Sea Mask
Metop	Meteorological Operational Satellite
MLE	Maximum Likelihood Estimator
MSS	Multiple Solution Scheme
NRCS	Normalized Radar Cross-Section ( $\sigma^0$ )
NWP	Numerical Weather Prediction
OSI	Ocean and Sea Ice
OSCAT	Scatterometer onboard of the Indian Oceansat-2 and ScatSat-1 satellites
OWDP	OSCAT Wind Data Processor
PenWP	Pencil beam Wind Processor
QC	Quality Control
SAF	Satellite Application Facility
SDP	SeaWinds Data Processor
SST	Sea Surface Temperature
WVC	Wind Vector Cell, also called node or cell

**Table A.1** List of acronyms.
